

4. Rain water harvesting structures and utilization in the campus.

The institution is situated in a hilly area of Sundargarh district and rainfall is decreasing day by day. Hence, rain water harvesting is very essential in this area to raise the water level. The institution makes some plans to harvest the rain water. But, there is no systematic rain water harvesting structure in the College campus. However, the College campus is closed by boundaries on three sides and the college main building is situated on one side. Rain water accumulates in the college campus and it is being conserved & automatically harvested to raise the water level. More than 300 girls are staying in the two hostels of this College and they use a lot of water throughout the year. It is the responsibility of the College to provide safe drinking water and also for their daily use. So, rain water harvesting is to be emphasized in this institution.
